

## Addendum for Windshield Washer Reservoir Relocation

This addendum is for those that have our Behind the Grille Light Mount kit that includes the windshield washer reservoir relocation. This is not required if you have not relocated your windshield reservoir.

To allow room to mount the ARB Air Tank on the Passenger side fender support, you must first move the Windshield Washer Reservoir further inboard. To do this, follow the simple steps below.

1. Remove the bolts that attach the reservoir to the relocation brackets.
2. Loosen the upper bracket and rotate 180 degrees so that the mounting tab is closer to the engine.
3. Release the clip holding the heater hoses to the bracket. The bottom of the reservoir will end up going between both hoses on final install.
4. Separate the heater hoses and position to either side of the mount. \*see picture\*
5. Remove the clip holding the wire harness just behind the heater hose mount and position the harness towards the firewall and shown in the picture.
6. Using the supplied M8-1.25 x 70mm bolts and aluminum spacers, mount the reservoir. This will position the reservoir further inboard and closer to the engine.
7. You can now follow the directions to mount the ARB Air Tank to the fender support.
